

There are a number of ways to go about this, depending on how frequently you need to do this.

If you need to use an elevated command prompt regularly, your best bet is to pin an elevated command prompt to the task bar. This is simple enough;

Pin the command prompt to the task bar.

Right click on the icon to show the jumplist for it.

Right click on “Command Prompt”

Click on the button labelled “Advanced...”.

In the dialog that pops up, check “Run as administrator” and click OK on both dialogs.

Now whenever you click on this taskbar icon, it will launch the command prompt in elevated / admin mode.

A second method that is probably equally convenient is to press **[Win]+[X]**. On Windows 8 this will show a menu in the bottom left corner of the active screen with links to common Windows tools. This has shortcuts for both the command prompt and an for running the command prompt as admin.

Change Wallpapers for Multiple Monitors

While Windows 8 does support changing the wallpaper of each monitor individually, this isn't highlighted very well in the Windows 8 GUI. What Windows 8 does do is install special panoramic themes that have wallpapers that can span across two monitors.

If you want to apply two different wallpapers to your monitors, the process is simple. Open the wallpaper personalisation page of the control panel. Here instead of clicking on a wallpaper to set it, right click on any wallpaper. You will see an option for setting that wallpaper for all monitors, but you will also get the option to set it as the wallpaper for a particular monitor.

Configure Your Taskbar for Multiple Monitors

A pleasant surprise for those who boot Windows 8 on their multi-monitor computer for the first time is that each monitor will show a taskbar of its own.

In earlier versions, Windows users got one taskbar on their primary monitor, and that was all. Switching between applications could be a pain since you would have to click on one monitor while the results would appear in a different monitor. So people used third party software if they had to.

In Windows 8 each monitor will have its own taskbar, and you can even configure, to a degree, how they will work. There are three supported modes
