

Once you have created a pool, you can begin creating spaces. You can add more drives to a pool, rename a pool or delete a pool from here as well.

You can also create a new pool with a new batch of drives if you want. So you can have multiple pools with different storage spaces in each.

To use the storage spaces in a pool you need to connect all the drives in that pool, or enough drives such that all the data is available.

A very important thing to note about Storage Spaces is that they won't work on Windows XP, Vista or even 7. This is a new technology and will only be available in Windows 8 and above. Also if you use Linux, you may want to avoid this since it is currently not supported. Linux provides similar – but harder to use – features.
