

Adobe Acrobat PDF Reader

Although smartphones today have the ability to read PDF files by default, they may not have all the features of the original app made by Adobe. Thus, for people dealing with PDFs on a day-to-day basis, this is a must install. Other than

opening PDFs, this app brings features of the desktop version to mobile. For example, you can annotate by adding sticky notes or highlight, strike-through and underline text. There's also a freehand drawing tool. The app also supports filling out forms within a PDF and you can even sign a

document using your finger on the touchscreen.

bytNotes

In our super-busy lives, we can sometimes forget something somebody tells us over the phone, and then are stumped when they call you back to check. bytNotes is a nifty app to have for people like us — other than being a note-taking application, you can tag contacts for every note. That way, whenever they call you, bytNotes shows the note that you wrote right above the call answer-dismiss area. If you also have birthdays of your friends synced in Google Contacts, the app will also remind you if it's somebody's birthday when

they're calling you.
