

Quadrant

So that new smartphone comes out in the market boasting of specs that can break your sweat. But numbers and jargon are a marketer's best tools to charm the audience. So, to make sure how the phone stacks up in a purely objective manner, Quadrant is a free app that can run the hardware through a variety of benchmarks to prove its mettle. It tests the CPU, memory, I/O and 2D/3D performance. It will post its findings in a neat bar graph, pitting it against popular phones to give you an idea of how good

(or bad) it performs.

QuickPic

The default photo gallery app in stock Android doesn't have everything you may need. And don't we go berserk clicking tons of photos from our smartphone, yes? QuickPic is one of the most satisfying 3rd party viewers we've come across. It lets you organize your photos in folders. You can hide photos or folders easily; protect them with a password. Other than the default thumbnail view, there's also a list view. It does basic editing too; like crop, rotate and shrink. The app also lets you exclude folders while scanning to make the process

more efficient.
