

HEALTH AND FITNESS

Not only are mobile devices helping us be productive, they're also looking after our well-being. Then again, you can't be the most productive without being healthy first, right?

Health is wealth, as they say. And looking at the kind of money we're spending on electronics these days, wealth is the need of the hour. Smartphones and tablets have taken upon themselves roles of a variety of standalone devices, making the latter irrelevant. To an extent, they've also replaced real people who would have aided us in our fitness. In these gadgets, there are a bunch of sensors that help detect motion, orientation, direction and altitude precisely. This data is intelligently used by apps to aid you while you work out and even while you sleep. The GPS chip in your phone helps apps keep track of your movements, and uses this data to give you a snapshot of your exercise session — say a hike in the mountains or a cycling trip. There are apps that will help you exercise, keep a track of your food intake; even motivate you to let go of a bad habit. Finally, instead of gorging on junk food, apps can teach you how to cook a delicious healthy meal. Saying that you can't cook is no longer an excuse — they have video instructions. What more can one ask for?
