

Bump

Two things that we exchange the most on smart phones are contact and photos. The digital information sharing apps have enabled easy and instant sharing of these. As the name suggest, Bump is an app that enables instant contact and photo exchange by literally bumping two phones together. The Bump app initially requires you to “bump” two phones together so that only people you know can send content to you, or receive content from you. Once you’ve Bump’ed, the app lets you swap pictures, contacts, exchange other multimedia with a fellow

Bump user you know

DocScanner

Gone are the days when you had to rummage through piles and piles of papers to find that one important document. Scanning apps have made going paperless very easy. DocScanner digitizes your paper documents into PDF files by scanning them through your phone’s in-built camera. Be it documents, notes, receipts or even visiting card; all it takes is a snap (need not be a perfect snap or shot from a straight angle) to create a digital record. And the best bit is, DocScanner comes with auto-upload to cloud storage services such

as Evernote, Dropbox, and Google Drive. DocScanner is like a portable

scanner in your pocket.
