

MX Player

MX Player is a good third-party video player that supports most popular video formats. It can make use of your phone's GPU and multiple cores

to play them better. MX Player has nifty gestures to let you control volume and seek and even brightness. It has a lock button that prevents accidentally hitting the back button, quitting from the video. Subtitles are supported too. Lastly, the player remembers the position where you last left watching, so you can get right back to watching your video from

there the next time.

Swiftkey Flow

Although stock Android 4.2's keyboard is fairly usable, the same can't be said about custom keyboards that some manufacturers slap on. SwiftKey's claim-to-fame was its word prediction capability. Its learning algorithms

make you type less, and simply tap on the relevant option presented above the QWERTY. SwiftKey Flow adds the word-tracing feature popularised by 'Swype', another alternative keyboard app. This comes in handy when you're single-handedly using a giant Android phone screen. The most amazing feature yet is that you can keep typing (or swiping) without putting spaces; it automatically adds them. Finally, there's Hinglish support

and a split-keyboard layout on the tablet version.
