

LightFlow

If your Android phone has a multi-color LED notification light, then definitely consider installing LightFlow. It gives you granular control over that LED light. So, you can make it blink green for WhatsApp, blue for Twitter/FB etc. You can control the rate of blinking and color amongst a myriad of other settings. So, once you've done all the dirty work, you know the kind of notification your phone is blinking with even before you turn the screen on. You can even have a different glow for a WhatsApp group message and a one-on-one conversation (thus making your

phone a little less disruptive).

Talking Caller ID

As the name suggests, the app uses Android's text-to-speech engine to speak out names of the callers. The free version gives you a glimpse of what the app can do, but paying ₹82 gives you access to the following features — you can either choose for it to speak the name once, before fading into your ringtone, or have it speak multiple times. Or do away with the ringtone altogether and just have the contact name spoken as the ringtone. It can speak for

all contacts, selected ones or only ones that aren't in your phonebook. The

paid version also gets rid of the ads.
