

USB Disk

iOS doesn't have a centralised file management system. Files are encapsulated within their apps. USB Disk is a handy third-party file manager to have installed. Its multiple uses include saving files from apps such as Mail or Safari for later viewing. Or say

you want to copy a few files from a friend's computer on your iPhone or iPad, this app can be used in conjunction with the 'File Sharing' menu in iTunes. Since it's a file manager, you can create folders and organise files better. Lastly, it also acts as a viewer for all file formats that the iPad

supports by default.

Data Usage

Since Android 4.0, there's an option within the Settings menu to monitor your mobile internet usage. Unfortunately, iOS doesn't have something like this yet. Data Usage is an app that monitors not only mobile internet but even Wi-Fi usage. Initially, it will ask you to fill in your billing cycle date and the data plan to which you're subscribed. Once it starts monitoring, you get statistical data and projections, indicating whether there's a chance you'll overuse. It sends out system notifications when you reach a certain percentage of usage. If you want a

simpler app, then try Dataman Next.
