

Penultimate

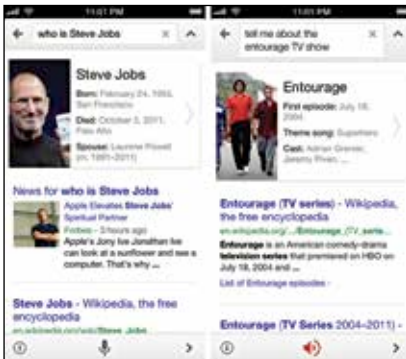

The iPad was designed to be used with fingers only, but that didn't stop accessory makers from selling styluses and app devs from releasing sketching apps. Penultimate has been a highly recommended app of all time. Plus, now it's free on the App Store (was ₹275 earlier). The app allows you to write and sketch as you please on a blank piece of virtual paper. Using Optical Character Recognition, it can recognise what you've handwritten, so you can use the search menu to find stuff. It also has a palm detection feature so you can rest your hands on the screen as

you write, hassle free.

Google Search

Siri brought a human-like approach to voice recognition where you could ask a question in spoken English and algorithms would figure out the context. Although helpful, there are times when Siri doesn't do a good job of understanding you (especially with our Indian

accent). Thus, Google Search is a must-have on an iOS device because, for one, its voice recognition abilities are better tuned to our native English accent. It uses Knowledge Graph to figure out the context in your query

and presents relevant information in a card format.
