

gMaps

Although Windows Phone comes built-in with Bing Maps, in our experience it doesn't have as many locations plotted as good ol' Google Maps. Unfortunately, Google doesn't a maps app for Microsoft's platform. But that doesn't mean you're shunned from using it. gMaps is a free app on the Windows Phone Store that gives you Google mapping data wrapped in a third-party layer. You get the usual features such as satellite view, traffic and local info etc. You may not get voice-guided turn-by-turn navigation, but it at least gives you a list

of directions. For ₹110, you can get rid of the ads permanently.

Translator

Although Google Translate has image recognition now, we remember this shown off by Microsoft in the Bing Translator app before. With the app, you can point your camera to a signboard or a restaurant menu and it translates text on the fly. Or it can listen to spoken text and serve it to you in a language you can understand. The best part is that you can download language and phrase “books” so that they can be used offline for converting text and images — a blessing to foreign travellers without a data plan. To help you improve the local tongue, it also

has a ‘Word of the Day’ tile.
