

SkyDrive

SkyDrive is Microsoft's cloud storage service, which offers tight integration with the Windows Phone platform. For example, you can upload photos taken with the camera or Office documents to SkyDrive. The app allows you to manage your files better on the phone itself. You can move, rename, delete, take batch actions for the prior three and create folders. The app can also generate a link for a file that you want to share with other people. Since it's the one place where all your content on the cloud is collectively

shown, you can search for stuff more easily.

UC Browser

Internet Explorer for Windows Phone lacks a lot of common, usable elements. Like a Forward button for instance, or the ability to search using Google. UC Browser is a good replacement that fortunately puts navigation buttons right at the bottom, and switching between tabs is faster thanks to its design. Then there's the incognito mode for private browsing sessions. There's also a speed mode for faster access to websites, a reader mode and a night mode that dims the brightness. There's a built-in download

manager and auto full-screen when in landscape mode.
