

Nirbhaya

The app, named after the symbolic moniker given to the deceased Delhi rape victim, was launched by Pune-based SmartCloud Infotech. In an emergency situation it lets you send a distress message to a contact group previously specified by you. On the home-screen of the app, you have a set of five buttons to each of which you assign a group of contacts to send a message or call in case of an emergency. You can assign different groups to different sort of emergencies; for instance you can group together local police authorities or hospitals or close relatives.

Fightback

This app was developed by Mahindra Group company CanvasM. It allows the user to send an SOS message via SMS, email and Facebook at the press of a single key. Pushing a central button will generate a security alert, which then uses communication channels such as SMS, emails and Facebook to give out a panic message along with the exact location of the user. The user interface is quite simple and the alert is triggered

immediately once you press the [fB] button of the app. SMSes and emails are quickly sent to the contacts you chose along with your exact location. It also keeps a record of all alerts raised on a Google Map anonymously, to

make you aware of danger areas.
