

Android Lost

This is a unique app in the sense that the app doesn't have much in terms of a user interface, but it can be controlled from a web browser. It has a boatload of remote features such as remote locking, making the app invisible while still tracking the phone, actually installing the app after your phone is lost, fetching the

location details of your phone, taking pictures from the front and rear camera, sounding an alarm, remotely activating or deactivating Wi-Fi/Bluetooth/GPS, sending a message to the person who has found your phone, remotely erasing SD card as well as performing a remote phone

wipe. All this for free!

Find My iPhone

This is the most renowned app for locating missing iOS devices — be it the iPhone, iPad or iPod Touch. Using another iOS device, you can locate your iPhone and remotely protect your data by either locking your phone or erasing all your data. It gives you three main options once you select the lost iOS device: Play Sound which activates an alarm sound; Lost Mode (iOS 6 or later) using which you can set a 4-digit passcode to lock your phone or iOS device and Erase Device which remotely wipes all data from your iPhone or other iOS device. All this while it shows you the location where

your iPhone is lost.
