

LegGodt, meaning play well (coincidentally also meaning 'I put together', or 'I study' in Latin). Being all of only around 5cm³ in volume, an 8-stud LEGO brick forms the base for countless possible combinations (six same coloured 8 stud bricks can be combined in 102,981,500 ways).

Developing in the child a natural sense of imagination and critical judgement, LEGO has always been a hit with parents, teachers and children alike. Ranging from toy sets that involve building cars and ships to doll houses for girls, LEGO bricks are tailor-made to be enjoyed by all ages and genders alike. The LEGO phenomenon even extended on to the digital world having its impact on a variety of platforms – from LEGO based music videos to LEGO video games, LEGO enthusiasts have continuously captured fiction and events of the modern day, immortalising them in miniature. With more than 200 billion LEGO elements manufactured to date, it's of no surprise that LEGO was voted by Fortune magazine, as the "Toy of the Century", and also makes its way into the top 100 inventions of mankind.

Lenses

If objects around you begin to appear blurry and your eyes have to strain to focus, a trip to the optometrist is in order. What do you think the doctor would recommend? What else but another one of mankind's best inventions – lenses. A lens is an optical device that refracts light beams to make them either converge or diverge. Lenses are typically made of glass or plastic. Then there are lenses which don't refract light. Instead they refract the non-visual portion of electromagnetic spectrum, e.g. microwaves.
