

certain amount of transparency to show applications and tasks running in the background. iOS 7 offers a neat effect to the visual design by using parallax effect to ensure that users can sense the depth of icons by changing the angle at which they are looking. Though some of these design elements seem more hype and less function. Read more about what we think in the “What we don’t like chapter”.

Besides visual design changes Apple introduced an array of features that justifies the claim of iOS being the biggest change in the iOS ecosystem. Control Centre feature was finally introduced

The layering and parallax effect

that allows quicker access to certain commonly used features. The centre has the same visual theme that is the dominating theme of iOS 7. Multi-tasking is vastly enhanced and so is the interfacing and feature interaction. Airdrop is another headlining feature. Another feature that made waves is the TouchID feature security that enables the user to unlock a feature by using a thumb print scanner embedded in the unlock button..

Since the launch of iOS 7 there has been a divide in opinions which is understandable since it is the first time Apple has actually tried to experiment with design and interface. There are obvious comparisons being drawn between Palm OS, Windows Phone and Android.

What the iOS 7 has done right though is that it has made a step in a new direction by moving away from the safe, tried and tested formula. Instead, led by Jony Ive, Apple has made the bold move to reconstruct the entire iOS experience.

If we had to summarise we’d say iOS 7 is a mash up of all the core functionalities of the previous iOS bundled together with some neat added features and redesigned with a different visual overlay.
