

data if something untoward happens in the upgrade process.

Backing Up your iPhone/iPad before Upgradation:

Even though, there haven't been many cases where users lost data when upgrading iOS versions, keeping a backup of all your important data is always a good idea. There are two ways in which you can take your backup:

1. Via the iOS device:

To take a backup from your iOS device itself, one would need an iCloud account and iCloud Backup option has to be enabled on your device. For that, go to Settings>iCloud>Storage & Backup, toggle the switch to "On" for iCloud Backup. Then tap on "Back up Now" to start the backup process. The backup process would start only when you are connected to a Wi-Fi network and not 3G. Once the Cloud Backup option is turned on, the device would start taking backup automatically whenever the device is connected to a power source, locked and is on a Wi-Fi network.

By Default, Apple gives you 5.0 GB of total storage. You can buy more storage by clicking on "Buy more Storage" option in Settings > iCloud >

The Storage & Backup settings menu
