

7. Multitasking: Quit multiple apps

Earlier you could list all apps running on your iOS device by double tapping the Home-button or sliding up using four fingers. Quitting them was a bit of a pain though: long pressing on them, and tapping on the small red dot over the wobbly icons. iOS 7 has made the task only a swipe away. Just flick the superfluous app upwards. This will make sure you get the full power of your iOS when extra apps are not running in the background. What is even better is that you can quit multiple apps. Its only limited by the number of fingers you have to spare.

8. Parallax effect

So iOS 7 brings with it a three dimensional feel to your iDevice. Did you notice that yet? With every movement of your phone, the wallpaper behind the icons shifts and tilts. It has added layers to your screen, giving you a perception of depth. There's also a change in the way you return to the Home screen, the apps and icons fly into their places. This was the brainchild of Apple's design guru Jonathan Ive.

Apparently, not many people happen to agree with Jonathan's idea of picturesqueness. Some people have even been physically sick due to the transitions (which we still find hard to believe). If you're also irked by this effect, you can reduce it, but can't completely do away with it. Go to Settings > General > Accessibility > Reduce Motion, and turn it off by the toggle switch (which would then turn green). This would turn off the moving wallpapers and all other transitions that are causing you motion sickness. Another reason to turn it off would be to save your battery, because all these little things drink a lot of your phone's juice.

For most people, it has been a fun feature and you can choose your wallpaper by going to Settings > Wallpapers & Brightness. You can choose from your
