

green. Place it upright and you can measure the inclination or check for the perpendicularity of any surface such as a wall.

15. Readability: Text Size and more

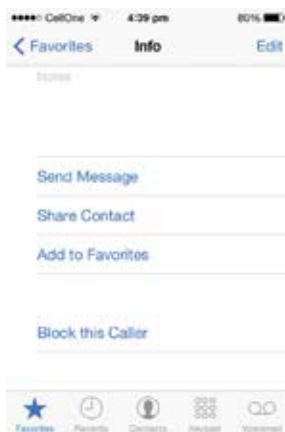

If you're having a hard time reading text on your iPhone, iOS 7 is here to fix it. Now you can set the text size according to your needs with an easy slider provided under the Settings > General > Text Size tab. This wouldn't make every word on your screen bigger, but is supported by some of the apps now. More importantly, it will increase the font size of your Mails and Messages.

If you're having a hard time to adjust to the new look and want to make iOS more legible, you can go to Settings > General > Accessibility and make system text bold, change text size, or increase contrast (this will require a restart of your iPhone). There a toggle switch for turning on/off labels that creates a small circle on every toggle switch that is off, and a vertical bar on each one that is on. It's just a little extra something, as the color of the switch, i.e green when on and greyish-white when off is sufficient to determine its state. You can also invert the colors to give your iPhone/iPad a retro feel.

16. Block contacts

Does someone have your number and you wish they can't call you? Sure you do. Now open the contact of the annoying person, scroll down and tap Block This Caller the bottom of the screen. Or tap the "i" against the call log of that person, and on the Info screen scroll to the bottom and again, select Block this Caller. Block people to refuse incoming calls, messages and FaceTime calls.

You can review your blocked-list at Settings > Phone > Blocked. You can also add people here, tap Add New and then select the contact of the person you don't want to take calls from. If you change your mind later, you can always unblock people by pressing Edit and tapping the red circles in the blocked contacts' list and selecting Unblock.

Block those annoying telemarketers
