

is the Groups option which once touched allows you to custom select your contacts list. It can be anything from your iCloud's contact list to your Facebook contacts list, depending on the different apps you use on your device.

Keyboard: The cleanest and least cluttered part of your Phone app. This screen presents you with your usual dial pad and a big Call button at the bottom of the screen. Just punch away the number you eidetic genius and you're good to go on a call. If the number you are dialling is already saved in your contacts then the name will appear under the number you've dialled. In case of any errors or corrections a backspace button appears to the right of the dialled number

that can be touched to erase the digits. You can also save a dialled number by touching the "Add to Contacts" option that appears under the number you are dialling. When touched it asks you if you'd like to make a new contact or save the number to an already existing contact. Presto! That's it.

Voicemail: If you have a voicemail service through your service provider then this is where all your voicemail settings and calls will be found.

Messaging

The iPhone has two main forms of messaging - SMS or iMessage. The former is the same short messaging service that has been around since the beginning and the latter is Apple's cross-platform chatting that uses your email ID and data plan to send and receive messages with other Apple users. It only works with other Apple products (Mac OS devices or iOS devices like iPod touch).

SMS/MMS: The iOS 7 messaging app hasn't changed radically since

The All Contacts menu
