

It's not that the OS itself is slow, far from it. To put it another way, say you're buying a train ticket and you're in a hurry, but you still have to wait for the attendant to courtesy and bow and doff his hat at you before asking you what you want. It's novel at first, but if you've got to buy a ticket every single day, it'll eventually get frustrating. To top it off, animations for the iPad still haven't been properly refined for the gestures that you'd use (more on that later).

Folders

This is a feature that iOS 7 badly needed. Having folders that could only hold a fixed number of apps was very limiting and the prospect of scrolling through half a dozen home-screens just to get at the app you want is not something that appealed to everyone. Apple, in all its so-called wisdom decided to incorporate folders that are seemingly infinite in capacity, but also decided that instead of scrolling through a dozen home-screens, you'll now have to swipe through a dozen folder screens.

The magic number is 9?

Why? Instead of the 20+ apps per screen, you're now restricted to a 3x3 grid of 9.

If that wasn't bad enough, the folders are treated as home-screens in themselves. In effect, if you delete or move an app from one screen of a folder, there will be a gap in that folder; the other apps will not reposition themselves to make up for that gap. You can literally have a dozen screens in a folder with one app each.

Dragging and dropping

Dragging and dropping apps has always been a pain in iOS owing to the fact that you can't select more than one app at a time, but this isn't the main problem. The main problem is that with this new folder system that Apple has implemented, dragging a file from a folder involves opening the folder (followed by a zoom-in animation), swiping to the app you want, dragging that app out of the folder, waiting a second or two till the view zooms out to the home-screen and then dropping the app. It's even worse if you want to
