

add the app to another folder as you will have to sit through more of those painful zooming animations.

iOS 7 on iPad

The iPad seems to be the self-sacrificing elder brother who's just being taken for granted. iOS 7 has just been slapped on to the iPad with compensation for the higher screen resolution. This is a problem because design decisions that make sense on the iPod and iPhone only create trouble for the iPad. We'll start with the folders, for a device that meas-

ures 9.7-inches diagonally, fitting apps into a 3x3 folder seems pointless. Why not take advantage of the increased real-estate on offer and fit more icons?

Even the animations are a bit off. If you use the home button a lot (On an iPad? Really?) and ignore the five-finger pinch, you won't notice anything odd. If you do try the gesture, you'll realise that the animations haven't been properly updated to suit that gesture and it's a bit jerky. Gestures also don't work in the NewsStand app for some reason. We must admit, these are very minor issues, but they add up and stand out more because of the care taken everywhere else than any other factor.

Another issue, again a minor one, is the clock app on the iPad. The earlier one was more informative at a glance than the first one. It's not that it's functionally very different, it's just that the blue on black colour scheme that was used to highlight the active alarms was more visually apparent than the current light grey on white lines that are almost invisible.

Keyboard

The new keyboard is aesthetically in-line with the iOS7 design, but the problem is that apps have to be updated to make use

When do we wake up exactly?

Too many keyboards
