

Hide Newsstand in a folder

Newsstand is now more like an app than a part of Home Screen. From what we've seen, people used to hate Newsstand because of its inability to hide in a folder. Being a standalone app now it can be hidden into a folder if you don't like it lying in between your apps.

Spot a newly installed app

In iOS 6 whenever a new app was installed the app icon showed a 'New' banner on it. If you're lost in finding your new app, let me tell you in iOS 7 the app icon shows a tiny blue dot beside every newly installed and unopened app.

See the revamped weather app

The sullen weather app suddenly becomes pleasant with the addition of amazing animations in iOS 7. The revamped app shows cities in tabbed manner. Pinch over the city to get its complete weather information. Tap on the temperature to get more information about it and swipe left/right on the hourly forecast to see it for rest of the day.

Get maxed out interface for iPhone apps (iPad)

The iPhone-only apps installed on iPad will get maxed-out interface by default; making it look like an iPad compatible application. You'll not have to manually switch between the interface anymore.

Know if you're ahead or behind of other time zones

The clock app now readily shows by how many hours you're ahead or behind the other timezones added. If you want to see by how many hours India is ahead of Cupertino, go to Clock app > World Clock > Tap the '+' button > Search for 'Cupertino' > Tap the result. The Cupertino clock will be added and you'll see the time lag just right there. Similarly you can do it for other time zones as well.

Know if you're ahead of behind other time zones easily
