

Share files between iDevices

Following the Macs, Apple adds Airdrop support to iOS as well. Airdrop allows you to send media to other devices via Bluetooth or Wi-Fi. The other device needs to be Airdrop compatible iDevice to receive files which can be an iPhone 5, iPod Touch 5G, iPad 4 or iPad Mini.

Save your data usage

iOS 7 introduced an unexpected feature that will help you to save your data usage. You can restrict any app running in the background from consuming cellular data usage by confining it to Wi-Fi alone. Head over to Settings > Cellular > Select the apps to use cellular data.

Quit multiple apps at once

The new Windows Phone alike multi-tasking tray of iOS 7 allows you to quit apps by swiping upwards, but this is not restricted to one app at a time. You can quit multiple apps at once by using multiple fingers. To do it, place your three fingers on the three visible app cards in the tray and swipe them upwards at once.

Enhance your battery backup

A new feature called 'Background App Refresh' will give a bump to your existing battery life. Any internet based application continuously refreshes in the background to fetch for updates. It makes use of Wi-Fi or cellular data and in-turn uses battery juices. Turn it off from Settings > General > Background App Refresh to save your battery.

Get the bubble level

The compass app isn't only a compass anymore, it includes a bubble level too. Get rid of uneven levels while hanging a portrait or assembling furniture by going to compass app and swiping right.

Close three apps at a time by swiping them upwards simultaneously
