

Let Safari create a password for you

You can rely on Safari completely if you're not able to think of a strong password by yourself. Whenever you arrive on a password field to fill in Safari will ask if you want it to suggest a secure password. This Safari-generated password will in your iCloud Keychain and will be available to access across different devices.

Get .com button

Missing the [.com](#) button in Safari? No, its not gone, it's still there hiding inside the '.' button. Long press the '.' button and you'll not only get the [.com](#) button but also [.org](#), [.in](#), [.co.in](#), [.edu](#), [.net](#), etc.

Long press the [dot] button to get .com in Safari

Swipe back in Safari

Safari is redesigned with minimal interface making web pages acquire more space on the screen. This redesign hides the menus and buttons while scrolling down through the web pages (hiding the back button as well). To use the 'Back' button you'll have to scroll the page upwards or tap on the address bar. Lengthy, isn't it? Instead just swipe from left to right anywhere on the web page and you'll back on the previous page.

Block adult websites/content

Blocking adult websites or online content was never so easy. This new feature is handy if you let your kid use of your phone. It can let you limit
