

Adding in game controller code to iOS allows hardware controllers to be used

introduced JavascriptCore framework, developers can access complete Javascript runtime from the native objective C. They can check the syntaxes, execute scripts and can even share certain objective C objects with Javascript.

Improved Xcode : Xcode 5

The new Xcode 5 that came with iOS 7 has significant improvements in UI. They have made the toolbar smaller thus giving more workspace. Its easier to add test targets by using the new test navigator. You can also see energy usage, CPU usage, Real-Time Memory in the debugger view. Xcode 5 comes with Auto Layout which lets you create interfaces that auto adjust themselves to devices, orientation, localisation , resolution etc. It also has better source control by adding a Source Control option in the top menu.

Inter-App Audio

With iOS 7 the AudioUnit Framework supports Inter-App audio which allows you to share and record audio from other apps. It allows you to use the audio output of one app as an input to another audio app.

Game Center

Similar to the overall design overhaul of iOS 7, Game Center is also re-designed. With new Game Center, players can have better interactivity using chat feature as well as they can play taking turns and can have trading tactics, negotiations and a lot more. Apple also increased the count of players on leaderboards from 25 to 100.
