

The future of System Administration

When asked about the future of this career, Ramarao responded saying, “There is a start and there is a end for all. New Technology will come and this will die soon.” Syed also admitted that most of the companies are moving towards Virtualisation and even network devices such as routers and switches are moving towards it through SDN (Software-Defined Networking).

So it seems that like everything else in the job market, System Administration is also (somewhat ironically) feeling the effects of the advent of technological advancement. With telecommunication becoming more and more popular, the job of a system administrator may just become a little more redundant. But there’s something to be said about having a person hands-on, taking care of setting up your system and maintaining it. 🇮🇳

Srikhant Subramaniam (name changed), an employee of a big media agency commented on how system administrators were slowly becoming defunct in larger corporations. Not the job in itself, per say; but the term ‘System Administrator’ is now slowly being replaced by ‘Infrastructure Manager’. Personally, it may sound more corporate, but doesn’t have the same feel as ‘System Admin’. But the times, they are a-changing. And one must keep moving.
