

It's available for multiple browsers, including Firefox and Safari, and the Windows and Mac OS X operating systems. There's also an open source Silverlight project for the Linux operating system. Curl is another RIA framework designed for business use.

Curl doesn't focus on graphics and advertising, but rather on applications that integrate with business data systems. Apart from these, other important RIA frameworks include Google Web Toolkit, JavaFX, Mozilla Prism and OpenLazlo.

RIA development can be done through a variety of frameworks and technologies. For coding the back-end part of the application, you can make use of programming languages such as Java, ColdFusion, PHP, Rails,

.NET, etc. For the client side you can use established MVC frameworks including Flex/ActionScript and Ajax, some emerging ones for Silverlight, and adapted Java frameworks for JavaFX. The primary quality for a developer is the ability to define the needs and capabilities of an application well if he wants to determine both, the back-end and the front-end application architecture well.

Requirements for RIA development

Irrespective of which RIA technology you're using or learning to use – be it Flex, Ajax, JavaFX, Silverlight, or any other RIA technology – there's a similarity in the architecture, in that most typically there will be a stateful client application and a back-end layer of separate services. Success in designing and building a rich internet application would depend a lot on how well this differentiation is understood and taken care of. RIA developers starting off see a salary upward of ₹10,00,000 per annum. An experienced Senior Technical Lead can get anywhere up to ₹20,00,000.

In today's global business environment, where customers are more demanding than ever and brand loyalty is increasingly difficult to obtain, deeper customer engagement is integral to an organisation's success. RIAs
