

The job has gained significance over time, and the testing team is now involved in the complete end-to-end process, beginning from the initial requirement reviews right until the testing of the final software. Testers with domain-specific knowledge and technical skills are in demand, paid more than our favourite developers, and those with remarkable skills are climbing the corporate ladder faster as well. Testing skills in niche areas such as SOA (Service-oriented architecture) testing, mobile-based testing, security testing and database-oriented testing are in top demand.

There was a time when a ratio of 1:10 prevailed in the industry where one tester was hired for every 10 developers. Now, however, the ratio is 1:4 or even 1:2 depending upon the criticality of the project; for instance a banking or insurance project.

Software Testing, also known as Quality Assurance Analysis, involves checking for bugs in software. Being a software tester, you need to be analytical, open-minded, creative, detail-oriented, passionate, patient and a good listener. Tamanna Bedi, QA manager at Graycell Technology Exports commented, “Software testing is a gold mine for the people who like to learn new stuff and want to dig down deep into the code. The industry looks for dynamic individuals who can possess the skill of finding bugs and can give innovative solution for the same.”

Why Software Testing?

If you're sitting on the fence unable to decide whether this is the career for you, here are a few motivations for getting into software testing:

Everything can't go the Google way and remain in beta forever
