

A software tester tests every minute detail

- ▶ **Good Packages and Returns:** Equal or better packages are being offered to QA Analysts (Quality Assurance) these days in comparison to their developer peers. The reason for this is the varied kinds of projects in the market where primary focus is not on development but on maintenance and performance. The other reason is data security which is the main concern for every client right now. Automation testers, performance testers, database testers and security testers are paid generously in the industry.
- ▶ **Ample On-site Opportunities:** Clients like having the confidence that the software they've paid for actually works. Therefore, they always need more testers on-site than developers to test their software thoroughly. Secondly, as testing is a short-term activity covering Staged Deliveries, Bug Fixing, Re-Testing, User Acceptance Testing (UAT) etc. it's easy to compensate. Testing done on-site also makes communication easier as there might be tests which require interaction with other technical groups and business experts usually present at on-site offices. And on-site locations might be exotic too.
- ▶ **Lucrative Alternate Career:** If you decide to take up the profile of a tester and should you decide this is not the line for you, there's another lucrative role waiting in the wings for you – that of a Business Analyst
