

```

• CURLOPT
• T_USERPWD => 'apikey',
• CURLOPT_POSTFIELDS =>
• 'price=100&currency=USD&item=TEST&custom=' .
• json_encode(array('o
• rder_id' => '1', 'returnurl' =>
• rawurlencode('http://domain.com'))),
• CURLOPT_RETURNTRANSFER => true,
• CURLOPT_HTTPAUTH => CURLAUTH_BASIC));
• $url = curl_exec($ch);
• curl_close($ch);
• header('Location:
• ' .
• $url
• );

```

Under T_USERPWD - you will enter the API key generated when you create an account in their website. This API key is simply a Bitcoin address where the money will go to.

Under price - you can modify the entry to reflect the price or simply refer to a variable which hosts the price of the object being sold

Once you implement the code with all the relevant details you should be able to make calls to the BIPS server from where the QR code will be generated and sent to your website for rendering.

Free alternative

You could skip that step and have your own QR code generated by a free service like Wolfram Alpha and use the return value on your page.

Example.

<http://www.wolframalpha.com/input/?i=bitcoin%3A1N7sMtFgaSWvcTg4sM5fRGSZTcZcSkXsYM%3Famount%3DO.01%26amp%3Blabel%3DTimepass+qr+code>

Enter the address after bitcoin% , in this case it is

1N7sMtFgaSWvcTg4sM5fRGSZTcZcSkXsYM

Enter the amount after amount%3D in bitcoins, in this case it is

0.01 BTC

Enter the label after label%3D , in this case it is

Timepass

Method 2: Use a plugin

Needless to say, this is the easier alternative. You can get plugins for any
