

LOM techniques almost make it seem like the object was inside the materials block just waiting to be released

freedom in choice of materials and extremely high grade of manufacturing bring it the closest in terms of quality to traditional manufacturing methods.

3. **Laminated Object Manufacturing:** is the name given to a printing methodology wherein the layers of paper, polymers or metal laminates are coated in adhesive and bound together. After this step, a high-precision laser cutter or blade carves out the desired object. This process uses thousands of adhesive layers from which an object is extracted, similar to sculpting from a marble block in the olden days.

The diversity and variety in the world of 3D printing may seem overwhelming but it isn't that dissimilar from 2D printing; just as choosing between inkjet, laser, all-in-one and photography grade printers is based on the user's need, so is the choice between the different types of 3D printers. Whatever be your need – professional prototyping or simple craftsmanship – there's a 3D printer out there that will suit your need.
