

it. The printer has a build area of 100mm x 100mm x 100mm and it can print in high resolution. Most items available on Thingiverse can fit on Tantillus' platform. The external power supply also allows for printing via battery power.

Interesting facts: The Tantillus was designed entirely using open source technology. It was modelled using the Blender mesh-modelling and animation program. Open source 3D printers such as Prusa, Thing-o-matic, Tantillus and Citadel Mendel were used to print the printer's prototypes with the help of open source software to power the machines. Even the computers used to design the models and the website used open source operating systems such as Mint 12 and Ubuntu. Openscad, the modelling program was used to make SVG files from STL files and all image modification (2D) was done using GIMP.

5. Ultimaker

The 'Ultimaker', like many others, is based on the RepRap project and is currently in its second version. Created in 2011, this 3D printer quickly became one of the most popular ones out there. The latest version Ultimaker 2 has an increased print volume, reliability and is more user-friendly. The company states that the designs are open source and can be modified by anyone, but only for non-commercial usage.

The Ultimaker is one of the fastest 3D printers around and can print at the speed of 30-300mm/s. It can print with an ultra-high resolution of 20 microns (0.02mm) or a high resolution of 60 microns (0.06mm) and medium and low resolutions of 100 (0.1mm) and 200 (0.2mm)

microns, respectively. The build volume of the printer is 225 mm x 225 mm x 205 mm. It weighs around 11.2 kgs and is available fully assembled unlike its previous version, which was also available as a DIY kit. The assembled printer costs around \$2,750.

The Ultimaker uses its own open source software called 'Cura' to print. It's quick to understand and novices can print with ease. It also has advanced
