

printer was also used to print an ear out of silicone gel. It has also printed ice, metal and a replacement bone. Depending on the material, the appropriate hardening method is employed (among other options, this can be heat or UV rays).

The Fab@Home project intends to bring personal fabrication to every household to ensure that everybody can give shape to their ideas. Currently,

you can create miniature models, food items and items with electrical parts. The Fab@Home printer is in its second version with a better design, reduced cost and build time than the first.

8. LulzBot TAZ

It may sound like an internet troll but the RepRap style ‘LulzBot Taz’ is definitely not one. Although, the LulzBot TAZ costs \$2,194, it’s worth every penny. LulzBot TAZ gives you a wide variety of printing material options such as ABS, PLA, HIPS, PVA, translucent plastic, glow-in-the-dark, wood filament; and with add-ons, nylon, polycarbonate and more. You can also print without a computer as the printer comes embedded with an LCD screen and an SD card slot. The TAZ comes with a 0.35mm nozzle with additional, interchangeable options available. LulzBot has included the designs for a model with dual extruder online on its website LulzBot.com.

It prints with a layer thickness of 0.075 mm-0.35 mm, which is changeable with the optional 0.75mm nozzle. It also has a good print speed of 200 mm/sec and can print on an area of 298 mm x 275 mm x 250 mm. Weighing 11 kgs, it’s portable enough to be carried around. The LulzBot TAZ is an open source printer and therefore has good community support and can be improved upon
