

you prefer to buy a kit or an assembled model, there are plenty of vendors who manufacture the Prusa i3 and you should have no difficulty finding it.

13. DeltaTrix 3D printer

The 'DeltaTrix 3D printer' is built on the delta robot platform (it consists of three arms connected to joints at the base and the use of parallelograms in the arms maintains the orientation of the end effector). With this design, only the printer heads need to move and not the work piece. This helps achieve faster printing speed. It uses an LCD display and an SD memory card to print models. There is no need to attach it to a computer.

Currently, it uses Repetier (software on PC) and Marlin (firmware) on the RAMPS electronics. The DeltaTrix 3D printer can print with PLA and ABS. The printing area is around 280 mm in diameter and 280 mm in height. The nozzle size is 0.3 or 0.5 mm. The future goals for this Kickstarter project are to introduce automatic levelling by means of an optical sensor and provision for dual printer heads assembly.

14. RepRap-based Prusa Mendel

The 'Prusa Mendel' is easily the most widespread open source 3D printer based on the RepRap project. Angad Daryani, a 15-year-old Mumbai resident went ahead and built a Prusa Mendel as buying a 3D printer would have been very expensive. The Prusa Mendel uses the Fused Filament Fabrication method of printing. The extruder employs stepper motors to

extrude plastic and uses four main plastic parts. RAMPS is the 3D printer's electronic platform. Aangad used the Google SketchUp tool as a 3D design tool and Pronterface as a software control panel to control the various aspects of the printer. Angad aims to sell assembled printers at under Rs. 20,000 – the cheapest 3D printer in India.

15. Graber i3 3D Printer

The 'Graber i3' 3D printer by Evotech Robotics is a variant of the popular Prusa i3 and is built to be more stable and easy to assemble and maintain.
