

The first on our list is Afaté Gnikou, a native of the Togolese Republic, Afaté, after being fascinated by the capabilities of a Prusa Mendel, decided to build his own 3D printer using all the e-waste from Europe that gets dumped in open landfills there. After coming through these scrap yards, salvaging

The Eventorbot

parts from old scanners and mainframes, Afaté finally managed to build his first working prototype after six months of toil. The first object this literature graduate (that's right, he has no background in engineering or science) made was a pen stand with the words 'droit a rever' or right to dream inscribed on it.

The second person on our list is 15 year old prodigy Angad Daryani, who assembled his first RepRap at the age of 13. He has subsequently developed his own DIY 2D printer, SharkBot and sells them.

The final entrant on our list of inspirational people is Instructables user Mastermind. Being an engineering student with who didn't have a few

The LEGObot by Mastermind

hundred dollars lying around, he used his old legos (there were lying around) and using a hot glue gun and the kind of motors camcorders use to move the lens back and forth and built his hot glue 3D printer. Since this is just a prototype, the possibilities for this design are limitless and there's some serious stuff we can expect.

Well, we hope we have included all the important things required to build your own 3D printer. You can find all the resources you might need at reprap.org.

Good bye and good luck!
