

3Dtin

[\[http://www.3dtin.com/\]](http://www.3dtin.com/)

3Dtin is an online CAD program that allows users to play, learn and create objects through their browser. The online program comes with a very intuitive interface and solid block modeling system which makes initial object design very fast. The program is very useful towards creating basic shapes and types but isn't suitable for detailed surface models.

Tinkercad teaches users how to think in CAD using combined sets of basic shape objects to make complex designs.

The Best Match

For both professional CAD users as well beginners, it is worth noting that the choice of design programs should be made taking into consideration two main points; the type of printer you are using and the level of complexity required. Those who are interested in pursuing 3D printing as a hobby or experimentation would be best served if they gradually worked their way towards learning the softwares, starting from the free open source programs like Tinkercad before they delve into Solidworks.

Softwares like those in the Autodesk series require hundreds of hours of professional training and are complicated to operate without specialised knowledge. In addition to which, certain printers aren't capable of the fabricating the level of detail that is virtualized in the advanced softwares. By matching their requirements and resources with the complexity of their desired projects, users will be able to save significant amount of time and pain.
