

printers who are commissioned to carry out printing services. When a customer of the website selects a design for printing, the various 3D print services providers bid for the job and the designer of the model gets a share of the sales. The website has recently gone public and is in its beta stages of development with investor confidence high in its potential success.

6. **CGTrader** - CGTrader is a mash-up of a marketplace and code repository for 3D designs. Users can use the platform to sell, buy, commission and request designs from the community. Along with this service users can also search through one of the biggest repositories of 3D designs on the web. Its important to note that that 3D designs available have been accumulated over years and are not prepped for 3D printing. Users can filter for print ready files in case they are looking for a turnkey design file. Free files often times will not come with any instructions or guides on printing but all paid files are customer friendly.
7. **Create This** - Create This is a platform exclusively for designers who want to sell 3D print ready designs. The files available on the website come in the major 3D print file formats including STL and SCAD. All files prices are variable but the minimum rate is of USD \$1.49 with a 30 percent rate to the platform. Currently the website is under redesign which will allow users to search for files by format. Other additional features are expected to be rolled out over time.
8. **CreativeCrash** - Creative Crash is another 3D design online market that has a long history of traffic to their content. Compared to other sites that have been reviewed CreativeCrash offers a lesser share, of 55 percent, to designers on their platform but improves the likelihood of making a sale due to higher users. All designs shared on the website are on a non-exclusive basis and frankly can also be found on other free to share design websites.
9. **CubeHero** - Unlike the many 3D markets that we've seen, CubeHero is one of the truly free design and service repositories on the web. The design files hosted are of special interest as they are made to ease further customisation and experimentation. The changes history of the file is included in the file data along with the source file of the design. Additional information such as the materials appropriate for the design are also included. All through the site links you to the downloads of the files, hosting is done on GitHub. The number of 3D models is lesser as compared to most other websites but is always gradually increasing.
