

the 'Urbee' might just be produced in low-volume in the recent future. Other added accessories such as custom interiors or motorcycle helmets to fit the size of the head perfectly will also take the industry by storm.

► **Healthcare:** Perhaps Urbee - first 3D printed car

the most exciting and inspiring use of 3D printing is in medicine and healthcare. Medical solutions will become more customised for individual requirements. The breakthroughs in this field are extremely quick and awe-inspiring to say the least. The area of regenerative medicine will be greatly benefited. Chapter no. 3 has gone into these in much greater detail.

- **Other consumer goods:** As the number of materials used in 3D printing increases, we will see 3D printing impact our daily life on a much more personal level. For example, virtually any food can be created, customised into different shapes and sizes, or even meat produced without necessarily killing animals – making the breakfast of the Jetsons a reality. 3D printed clothes will start becoming widely available. Victoria's Secret has already modelled the first ever 3D printed lingerie, and there's only more to come. Jewellers will start using 3D printing over traditional manufacturing processes to create custom chains and necklaces. The way children will play will change forever, with 3D printers letting them download 3D designs and play with the toys that they want.

Bionic ear created by 3D printing

As all of these examples indicate, 3D printing has the potential to help meet the needs of people throughout the world. It can provide poor people
