

This shot was taken to determine how the two cameras would handle strong sources of light placed just outside the frame. The bookshelf (yes, that's what it is) was lit by a very bright 23 Watt

CFL lamp just 15 inches above it. As you can see, the iPhone totally kills the blacks in an attempt to bring out detail, while the Lumia 1020 retains the smooth blacks on the drape. However, the Lumia 1020's optics are susceptible to the halo effect (and even flare in some condition), but the iPhone 5S seems to be somewhat imper-

vious to such artefact.

A Flower arrangement shot at a wedding, being lit by those ugly purple-red-blue kind of LED lamps.

Again we see in the crop that the Lumia 1020 has lesser noise than the iPhone, but we also see that the iPhone shot is just slightly brighter than the Lumia's. The Nokia device seems to have a sharper image though.

Like: BACON

Yes. Bacon. Everyone loves it. Both shots are simply amazing, because they have bacon as the subject. Bacon, Bacon, Bacon. Actually this test is kind of redundant, because seriously, is it even possible to photograph bacon wrong? Look at it! The texture, the colour, the beauty in every curve – every little detail of this scrumptious delight highlights its incomparable beauty and makes even the most staunch dieter's mouth water in anticipation of what comes next.

Excuse me. We skipped breakfast. We'll be right back.
