

day to running a three day long marathon, who's complaining? Most of the cases in the market also double up as protection for your smartphone but finding reliable cases for older models, especially older Android models is where these guys tend to lose out.

If you fall in to the above category, your only choice is to go for a clunky battery pack that charges your device via USB cables. Banks can be as tiny as using AAA batteries to charge devices to a massive 26,000 mAh Li-ion battery if you spring for something like the Intocircuit Power Castle. Sure, 26,000 mAh may seem like a lot but you will definitely thank yourself when you're out trekking and it manages to charge your laptop, your phone and your GPS.

If you prefer something a little more minimal and you feel that a little elbow grease never hurt anybody, you should consider a hand cranked charger. The design is pretty basic really, the charger is a crank that turns

Another soul saved!

a dynamo that generates electricity. Plug your device in to the charger and start cranking to charge the battery. The advantage here is the fact that you really don't need to worry finding a power source or pray that the sun comes out to charge your solar panels.

Snap-on, snap-off.

An interesting crank charger is the SOSCharger. Why it is different is because it has a 2000 mAh lithium ion battery built in to it. You could charge the built in battery using a plug point or you could charge it by hand.

At the end of the day, it's really about whether you really need all these accessories or if you're just suffering gear acquisition syndrome so choose wisely and happy clicking.
