Photosynth

Photosynth by Microsoft, isn't like the other post processing apps mentioned on this list but it's a must have for any photographer who's interested in capturing the most with their photography. Photosynth initially started off as an experimental application to create amazing browsable three dimensional images of popular locations around the world. Now the app brings the power to capture your entire surroundings easily into the reach of a mobile phone camera. The app allows you to take panoramic photographs like never before by simply scanning your surroundings through the in-app camera view. The on screen indicators automatically photograph and stitch together your surroundings to a remarkable depth giving you a panoramic view that extends across dimensions. And even in hard to shoot environments, the app accepts your commands to shoot at a touch of the screen, when it can't be sure of whether what it sees is the right image. As a user experience the app is a wonder to work with and the online community gives you a doorway towards experiencing amazing places from all over the world.
