

across the board including Microsoft and OpenOffice files through the continued development of the Open Document format.

A unique offering from the NeoOffice office suite is its integration with Mac OS X Gatekeeper, which is supported on Mac OS 10.8 Mountain Lion build onwards. This feature is intended to protect users' machines against malware that may harm their computers. Due to the wide proliferation of various open source versions of the NeoOffice suite, the developers have an Apple authorised signature on each installer of NeoOffice ensuring that no malicious ware is used to exploit the systems. However, this may be considered a limiting feature as it means that only the employees of the core company, Planamesa Inc. are authorised to make direct changes that will be accepted by Mac OS X Gatekeeper as opposed to variations made by independent developers.

Look and feel

The NeoOffice suite is a seamless part of the Mac OS ecosystem with a sleek top screen menu bar from where its operations can be run. The application suite fits cozily within the Mac applications bar and uses efficient system memory; however, the recent version is considered to be more process heavy while running complex tasks such as producing media heavy files and executing large mathematical calculations. Nonetheless, these limitations don't pose a significant challenge to the application or the user with a sufficiently recent hardware system.
