

So many apps, services and connectivity tools are available

routers which make setting up a personal cloud easy and simple.

You should not consider using syncing features on your personal cloud as those are best served by free services like Dropbox. The key benefits of a personal cloud are around large data storage that can range in terabytes and can be massively taxing on your internet connection if you are constantly syncing. This of course means that your

personal cloud based Chrome OS machines should have a near constant connection to the internet or at least at any time when you are away and would like to have access to those files.

Keeping in mind that these personal clouds can be segmented, shared, collaborated on and accessed by multiple persons simultaneously, it is best recommended that it be limited to only a handful of people, due to the home use bandwidth constraints. You can also access this personal cloud from mobile devices which makes media viewing on tablets and mobile devices a pleasure since you don't have to worry about limited storage options.

There are two approaches you can take - one method is to let a PC or Mac storage system at home serve as your personal cloud which you can then access with your salvaged Chrome OS machines or conversely let your recovered Chrome OS be the personal cloud system which you can use as a personal cloud accessible from anywhere.

The most secure and simple means of setting up for the first option is to use paid for softwares like Polkast, LogMeIn Pro and Spotdopx which allow you to share files from your PC or Mac devices across to your Chrome machines. In case you have only one Chrome OS device and a single PC device the best option is Polkast. Their software offers free service for a single device setup and can be accessed via Android and iOS phones
