

Camera App Tweak

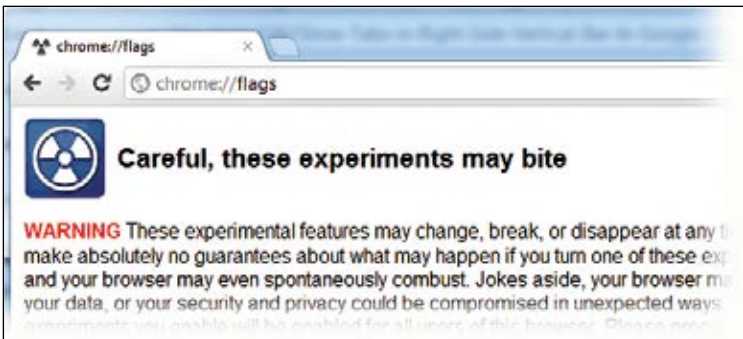

The camera app in Chrome OS accesses your machine's camera and allows you to take photographs for profile displays but if you type **CRAZYPONY** in the app you'll be given the option of choosing a video file to watch and apply any of the style effects of the camera app to the screenshots of the video.

Switching Accounts

Given the cloud hosted nature of Chrome OS applications it isn't unlikely that many people may use one Chrome OS device like a desktop or workstation in any given environment. For that purpose having multiple accounts on the same machine isn't uncommon. To quickly switch between different accounts all you have to do is press **Ctrl+Alt+Period** and **Ctrl+Alt+Comma**.

Experiments May Bite

Chrome OS is a system that is under constant development and on Chromebooks is seamlessly updated without any notice. But many of these updated features begin as experiments that are tested in developer mode and beta

Be careful with your Chrome OS experiments, as they may bite you back

mode for a while before making it to any stable update. Some of the experimental features can be very useful for most users and are worth testing out from time to time. In order to access these experimental features you just need to type in **chrome://flags** in the omnibar and a screen will be displayed with all the available experimental options. But be wary of glitches and problems as the warning advises: Careful, these experiments might bite. No need for worry since you can always roll back or simply turn off these features anytime you want.
