

Everything you've ever wanted to know

would include subjects like English, Science and Math. The entire class along with the teacher would learn the concept taught in the classroom in front of a computer. The students were welcome to make multiple visits to the computer lab and revisit concepts.

The '90s was when e-learning really took off. The internet was growing by leaps and bounds and computers were getting cheaper too. This gave e-learning the best opportunity to start exploring its potential. Companies like Blackboard and Desire2Learn started providing virtual learning environments where students were exposed to a virtualised classroom allowing the student to learn directly from a teacher and where a one to one conversation takes place through a threaded discussion or a chat.

Today, e-learning has moved from being a delivery platform and has become a new approach to learning that is tailored to fit around the user's lifestyle. It's also become synonymous with web learning. With better technology, e-learning can be delivered in roughly the same way across various platforms as well.

E-learning's biggest drawback was the lack of one-to-one communication and collaboration but with the aid of video conferencing, shared desktops and cloud computing, that too has become a thing of the past. A student sitting in Rwanda can not only interact with his mentor living in the US but the same student can also work on and present a project in
