

collaboration with a partner living in Japan. With the quantity of information available online only rising every minute, the average e-learner is also exposed to more information through online libraries when compared to the information available to a student who chooses to learn via traditional means.

Even the quality of teaching changes with the role of a teacher transforming from someone who dictates notes to that of a mentor or a guide whose limited time becomes even more valuable to the student.

What's wrong with a traditional classroom environment?

Speed

For starters, there is no such thing as learning at your own pace in this environment. Not only do different people grasp concepts at different paces but those who for some unavoidable reason end up missing a few classes have few ways to get back to speed.

This directly affects the pace at which one goes through the syllabus. With e-learning, easier subjects can be completed much faster and the tougher ones can be tackled at a much slower pace resulting in better understanding.

It's boring

In a traditional classroom, things can very easily become monotonous. Sitting at the same desk all day, staring at the same blackboard and teacher might end up having a negative effect on one's ability to concentrate and grasp concepts. This puts a lot of pressure on the teacher and not everyone sympathises with students who are weak in certain subjects.

Several studies have shown that the quality of grades rises as the number of students assigned to a teacher is reduced. Because the teacher is able to share their time with the class in such a way that each child receives more attention and thus, the grades of the class as a whole improve.

Your teacher is never all yours

The average classroom in most schools holds between 20 and 35 students with just one teacher and if you go to one of the fancier schools there's a teaching assistant to share the responsibility. This means that the teacher's attention is divided among all these students. The idea of individual attention is completely lost and in many cases the teachers and/or assistants are just not trained well enough to deal with such a large number of students, thus diluting the efficiency of the teacher. Once again, the fact that you share
