

- a. the modification exists
- b. what it's for.
- c. how many ways can one expect it to go wrong
- d. how to fix it in case it does go wrong
- e. how it's going to affect the engine if it's not there to name a few.

The traditional approach to this whole conundrum of getting everybody on the same page would involve, making a list of all the mechanics that need to be informed of this alteration, managing travel and/or accommodation for these mechanics, arrange for an instructor and arrange for a venue with necessary props to teach. If you think that's going to be time consuming and tedious, keep in mind that the problem of someone who joins a newbie needs to be taught too, the chances of the entire process needing a repetition for the same batch because they didn't quite get it is as huge as an elephant in a room.

The simpler, cost effective solution involves getting a camera and shooting the entire set of instructions and play it back to the mechanics saves time, money and effort. Since the file can be stored, the number of times it can be played back are virtually unlimited so refreshers and freshers are most welcome.

The future of instructional designing.
