

Another point where e-learning come to the organization's rescue is when it comes to updates. Even the tiniest update in the existing modules or technology can be effectively communicated to virtually every employee in the organization in less time than it would take you to snap your fingers. Or maybe not but you get the drift.

The great part about all of this is that the organization doesn't even need to get all the employees of each of its offices together. If the infrastructure permits, the entire organization can stay on top of things from the comforts of their desks and simply download the module or watch the instructional video online.

A third point where e-learning proves to be beneficial yet again is on the time front. Not only does it take very little time to get the information to the employees, the time taken to organize the training session is also greatly reduced. This is because the number of trainers is reduced to the few who are going to be featured in the video and venues down to the studio where it's going to be shot.

What to expect when you're educating (your self)

To tell you the truth, while e-learning is pretty good and stuff, it still leaves a lot to be desired. For starters, collaboration isn't as great as the real thing. Sure you have google docs' add-on that allows multiple users to work on the same document, you can use skype or hangouts to have face to face interactions with your partners but these things aren't as great as the real thing. Either that or we're too used to the familiar feeling of having our partners sitting at the desk and messaging their 'partners' while we're doing all the work.

Second and definitely the biggest limitation that e-learning has to its name is the fact that you need to be connected to the internet if you really want to get anywhere. Sure you can still learn off DVDs but do you really see yourself using the postal service to get in touch with your instructors?

Finally, the third limitation that e-learning seems to face is the learner him/herself because we as a race are not exactly as motivated as we really should be and because e-learning is rather dull when compared to say Mortal Kombat, we join the millions who have signed up for an online course and haven't bothered to finish it. But fret not for the very same feature that keeps up hooked to our gaming devices is going to help you learn too.

The idea being spoken about is the gamification of e-learning. It's already out there and you only expect it to gain popularity. By offering the users
