

ONLINE COURSE AGGREGATORS

There's an overwhelming number of websites offering courses across a variety of fields, and finding the right course for you can be quite cumbersome. To ease this process, there are a number of websites that aggregate courseware across a bunch of different learning websites, letting you search for courses from different MOOC providers. Some of the more reliable ones are Class Central (<http://dgit.in/FTClassCentral>), RedHoop (<http://dgit.in/FTRedHoop>), CourseBuffet (<http://dgit.in/FTCourseBuffet>) and SlideRule (<http://dgit.in/FTSlideRule>) which provide a searchable catalog of high-quality online courseware. CourseTalk (<http://dgit.in/FTCourseTalk>) is a similar site, but with the distinction of allowing students to review specific courses offered by learning providers. Additionally, Lifehacker, the popular blog, publishes a roundup of the best online courses being offered in Finance, Engineering, Humanities, Mathematics and Law twice a year, emulating the semester-based curriculum of a real college. (<http://dgit.in/LifehackerU>)

dents taking any course, it becomes impossible for instructors to manually evaluate assignments, hence professors never actually grade any of the work you submit during your course. In most cases, direct interaction with the professor is not possible, and the only option to resolve your doubts is via the online forums.

Notable Courses: Machine Learning, Probabilistic Graphical Models, A Beginner's Guide to Irrational Behavior, Introduction to Finance.

2 Udacity (<http://dgit.in/FTUdacity>)

Backed by industry stalwarts Peter Norvig (Director of Research at Google) and Sebastian Thrun (Research Professor at Stanford University and brainchild behind Google's self driving car, Google Class and Project Loom), Udacity hosts a selection of highly interactive and project-based courses, mainly centered around computer programming and web development. The courses often have a highly interesting project that the students will accomplish during the course of the programme - The Introduction to Computer Science course has students building a social network, while students learn how to build a blog during the course of Introduction to Web Development.

Udacity courses have quite a lot of pedigree, with the weight of Corporations like Google, AT&T, NVIDIA and Georgia Tech behind them. The Machine Learning courses are taught in conjunction with Georgia Tech, and
